Alma Mater Studiorum - Università di Bologna Corso di Laurea in Informatica

19 maggio 2025

Problem Description

- The project analyzes the performance of two Projection-Correction algorithms for reconstructing medical images affected by motion blur.
- The studied algorithms are:
 - Diffusion Posterior Sampling (DPS)
 - Regularization by Denoising with Diffusion (RED-Diff)
- Both methods are based on pre-trained diffusion models.
- Objective: evaluate the effectiveness of these methods in recovering degraded images.

Progetto 2 / 13

Approach

- Objective: Analyze the performance of Projection-Correction methods
 DPS and RED-Diff for motion blur removal on medical images
- Phase 1: Dataset preprocessing (128x128)
- Phase 2: Data augmentation to increase dataset diversity
- Phase 3: Training a DDIM diffusion model on medical data
- Phase 4: Simulation of motion blur and its removal
- Phase 5: Implementation and comparison of Projection-Correction methods: DPS and RED-Diff
- Phase 6: Quantitative evaluation of performance using metrics such as PSNR and SSIM
